

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1-27. (canceled)

28. (previously presented) An information record medium on which reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists, and

a plurality of audio data whose existence is indicated by the channel assignment information and recorded for each channel are recorded.

29. (previously presented) The information record medium according to claim 28, wherein the channel assignment information comprises a channel assignment table in which the speaker arrangement is associated with the bit arrangement.

30. (previously presented) The information record medium according to claim 28, wherein the plurality of audio data is packed or packetized, and arranged in a sequence corresponding to

an arrangement sequence of the plurality of bits by one or more sample units in each pack or each packet.

31. (previously presented) The information record medium according to claim 28, wherein a bit existing at a predetermined position in the bit arrangement indicates whether or not audio data for any channel not corresponding to a speaker position in the speaker arrangement exists.

32. (previously presented) The information record medium according to claim 31, wherein the bit existing at the predetermined position is an LSB (Least Significant Bit) in the bit arrangement and indicates whether or not audio data for a super woofer channel exists.

33. (previously presented) The information record medium according to claim 28, wherein

the bit arrangement is made of a plurality of bits arranged two dimensionally with a predetermined number of bits for each row over a predetermined number of rows,

the speaker arrangement is made of a plurality of speakers arranged on a plane corresponding to the two dimensional arrangement of the plurality of bits.

34. (previously presented) The information record medium according to claim 28, wherein

the speaker arrangement is made of a plurality of speakers arranged three dimensionally,

the bit arrangement includes a plurality of partial bit arrangements,

each of the plurality of partial bit arrangements is made of a plurality of bits arranged two dimensionally with a predetermined number of bits for each row over a predetermined number of rows, each partial bit arrangement being associated with a plurality of channels corresponding to a plurality of speakers arranged on a plane of the same height for each concerned partial bit arrangement, from among the plurality of speakers arranged three dimensionally,

the plurality of partial bit arrangements exist as many as the number of the planes.

35. (previously presented) The information record medium according to claim 34, wherein the reproduction control information further includes total channel number information to indicate a total channel number, layer information to indicate a total number of planes having different heights from each other allowing a three dimensional arrangement of speakers, and layer constitution information to indicate whether or not at least one speaker is disposed on each plane.

36. (previously presented) The information record medium according to claim 33, wherein at least one of the predetermined number of bits or the predetermined number of rows is variable.

37. (previously presented) An information record apparatus comprising:

a generating device for generating reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists;

a first recording device for recording the generated reproduction control information into a control information area on an information record medium; and

a second recording device for recording a plurality of audio data whose existence is indicated by the channel assignment information into a data area on the information record medium for each channel.

38. (previously presented) The information record apparatus according to claim 37, wherein the channel assignment information comprises a channel assignment table in which the speaker arrangement is associated with the bit arrangement.

39. (previously presented) The information record apparatus according to claim 37, wherein the plurality of audio data is packed or packetized, and arranged in a sequence corresponding to an arrangement sequence of the plurality of bits by one or more sample units in each pack or each packet.

40. (previously presented) The information record apparatus according to claim 37, wherein a bit existing at a predetermined position in the bit arrangement indicates whether or not audio data for any channel not corresponding to a speaker position in the speaker arrangement exists.

41. (previously presented) The information record apparatus according to claim 40, wherein the bit existing at the predetermined position is an LSB (Least Significant Bit) in the bit arrangement and indicates whether or not audio data for a super woofer channel exists.

42. (previously presented) The information record apparatus according to claim 37, wherein

the bit arrangement is made of a plurality of bits arranged two dimensionally with a predetermined number of bits for each row over a predetermined number of rows,

the speaker arrangement is made of a plurality of speakers arranged on a plane corresponding to the two dimensional arrangement of the plurality of bits.

43. (previously presented) The information record apparatus according to claim 37, wherein

the speaker arrangement is made of a plurality of speakers arranged three dimensionally,

the bit arrangement includes a plurality of partial bit arrangements,

each of the plurality of partial bit arrangements is made of a plurality of bits arranged two dimensionally with a predetermined number of bits for each row over a predetermined number of rows, each partial bit arrangement being associated with a plurality of channels corresponding to a plurality of speakers arranged on a plane of the same height for each concerned partial bit arrangement, from among the plurality of speakers arranged three dimensionally,

the plurality of partial bit arrangements exists as many as the number of the planes.

44. (previously presented) The information record apparatus according to claim 43, wherein the reproduction control information further includes total channel number information to indicate a total channel number, layer information to indicate a total number of planes having different heights from each other allowing a three dimensional arrangement of speakers, and layer constitution information to indicate whether or not at least one speaker is disposed on each plane.

45. (previously presented) The information record apparatus according to claim 42, wherein at least one of the predetermined number of bits or the predetermined number of rows is variable.

46. (previously presented) An information record method comprising:

a generating process of generating reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists;
a first recording process of recording the generated reproduction control information into a control information area on an information record medium; and

a second recording process of recording a plurality of audio data whose existence is indicated by the channel assignment information into a data area on the information record medium for each channel.

47. (previously presented) An information reproduction apparatus for reproducing a plurality of audio data from an information record medium on which reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists, and the plurality of audio data whose existence is indicated by the

channel assignment information and recorded for each channel are recorded, said information reproduction apparatus comprising:

a reading device for reading the plurality of audio data and the reproduction control information from the information record medium;

an identifying device for identifying channels of the plurality of audio data recorded in the information record medium, on the basis of each bit position in the bit arrangement relating to the channel assignment information included in the read reproduction control information; and

a reproducing device for reproducing the plurality of read audio data as a plurality of audio data for the identified each channel.

48. (previously presented) An information reproduction method of reproducing a plurality of audio data from an information record medium on which reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists, and the plurality of audio data whose existence is indicated by the channel assignment information and recorded for each channel are recorded, said information reproduction method comprising:

a reading process of reading the plurality of audio data and the reproduction control information from the information record medium;

an identifying process of identifying channels of the plurality of audio data recorded in the information record medium, on the basis of each bit position in the bit arrangement relating to the channel assignment information included in the read reproduction control information; and

a reproducing process of reproducing the plurality of read audio data as a plurality of audio data for the identified each channel.

49. (previously presented) An information record reproduction apparatus comprising:

a generating device for generating reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists;

a first recording device for recording the generated reproduction control information into a control information area on an information record medium;

a second recording device for recording a plurality of audio data whose existence is indicated by the channel assignment

information into a data area on the information record medium for each channel;

a reading device for reading the plurality of audio data and the reproduction control information from the information record medium;

an identifying device for identifying channels of the plurality of audio data recorded in the information record medium, on the basis of each bit position in the bit arrangement relating to the channel assignment information included in the read reproduction control information; and

a reproducing device for reproducing the plurality of read audio data as a plurality of audio data for the identified each channel.

50. (previously presented) An information record reproduction method comprising:

a generating process of generating reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists;

a first recording process of recording the generated reproduction control information into a control information area on an information record medium;

a second recording process of recording a plurality of audio data whose existence is indicated by the channel assignment information into a data area on the information record medium for each channel;

a reading process of reading the plurality of audio data and the reproduction control information from the information record medium;

an identifying process of identifying channels of the plurality of audio data recorded in the information record medium, on the basis of each bit position in the bit arrangement relating to the channel assignment information included in the read reproduction information; and

a reproducing process of reproducing the plurality of read audio data as a plurality of audio data for the identified each channel.

51. (currently amended) A computer program product embodied in a computer-readable medium for a recording control to control a computer provided for an information record apparatus comprising: a generating device for generating reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists; a first

recording device for recording the generated reproduction control information into a control information area on an information record medium; and a second recording device for recording a plurality of audio data whose existence is indicated by the channel assignment information into a data area on the information record medium for each channel, and to make the computer function as at least part of the generating device, the first recording device and the second recording device.

52. (currently amended) A computer program product embodied in a computer-readable medium for a reproduction control to control a computer provided for an information reproduction apparatus for reproducing a plurality of audio data from an information record medium on which reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists, and the plurality of audio data whose existence is indicated by the channel assignment information and recorded for each channel are recorded, said information reproduction apparatus comprising: a reading device for reading the plurality of audio data and the reproduction control information from the information record medium; an identifying device for identifying channels of the

plurality of audio data recorded in the information record medium, on the basis of each bit position in the bit arrangement relating to the channel assignment information included in the read reproduction control information; and a reproducing device for reproducing the plurality of read audio data as a plurality of audio data for the identified each channel, and to make the computer function as at least part of the reading device, the identifying device and the reproducing device.

53. (currently amended) A computer program product embodied in a computer-readable medium for a recording and reproduction control to control a computer provided for an information record reproduction apparatus comprising: a generating device for generating reproduction control information including channel assignment information in which each bit position in a bit arrangement made of a plurality of bits is assigned to each channel corresponding to each speaker position in a speaker arrangement made of a plurality of speakers, so that each bit value indicates whether or not audio data for each channel corresponding to each bit exists; first recording device for recording the generated reproduction control information into a control information area on an information record medium; a second recording device for recording a plurality of audio data whose existence is indicated by the channel assignment information into a data area on the information record medium for each channel; a reading device for reading the plurality of audio

data and the reproduction control information from the information record medium; an identifying device for identifying channels of the plurality of audio data recorded in the information record medium, on the basis of each bit position in the bit arrangement relating to the channel assignment information included in the read reproduction control information; and a reproducing device for reproducing the plurality of read audio data as a plurality of audio data for the identified each channel, and to make the computer function as at least part of the generating device, the first recording device, the second recording device, the reading device, the identifying device and the reproducing device.

54. (canceled)

55. (new) The information record medium according to claim 28, wherein the reproduction control information is set for each title.
